

NBA coefficients by position

2022-23 NBA salary sample | Three separate regressions; inputs selected independently within each position (VIF <= 5)

Weight: ridge prediction coefficient per 1 standard deviation (SD), used in the NCAA peer signal. **OLS beta:** separate log-salary coefficient for the stated increase. **Intervals and p-values apply only to OLS beta.** Neither number is a percentage of player value.

2 of 26 retained OLS associations meet Holm p <= 0.05 using the original 36-candidate correction family. Excluded means not retained, never a zero effect. Age and percentage-availability controls are outside this basketball-input table.

Read within each position: different retained inputs mean the columns have different adjustment sets; coefficient differences alone do not establish position priorities. Separate common-input tests are in Full statistical details. These exploratory NBA results do not validate NCAA or WBB pay.
